

# Interactions II: Recommendations

David Bamman

Info 202: Information Organization and Retrieval

Nov. 21, 2016

We design organizing systems because we have  
some **interaction** in mind

# Recommendation

- Providing **recommendations** is an interaction that's enabled by organizing systems

**smell-bound** ('smel-baʊnd) *adj*: held as if under a spell by the scent of books

# Recommendations

- Physical organizing systems mainly make implicit recommendations at the aggregate level
- Organizing principle #1: promote books that have the highest expected sales among **all** customers.
- Organizing principle #2: staff recommends books they like.

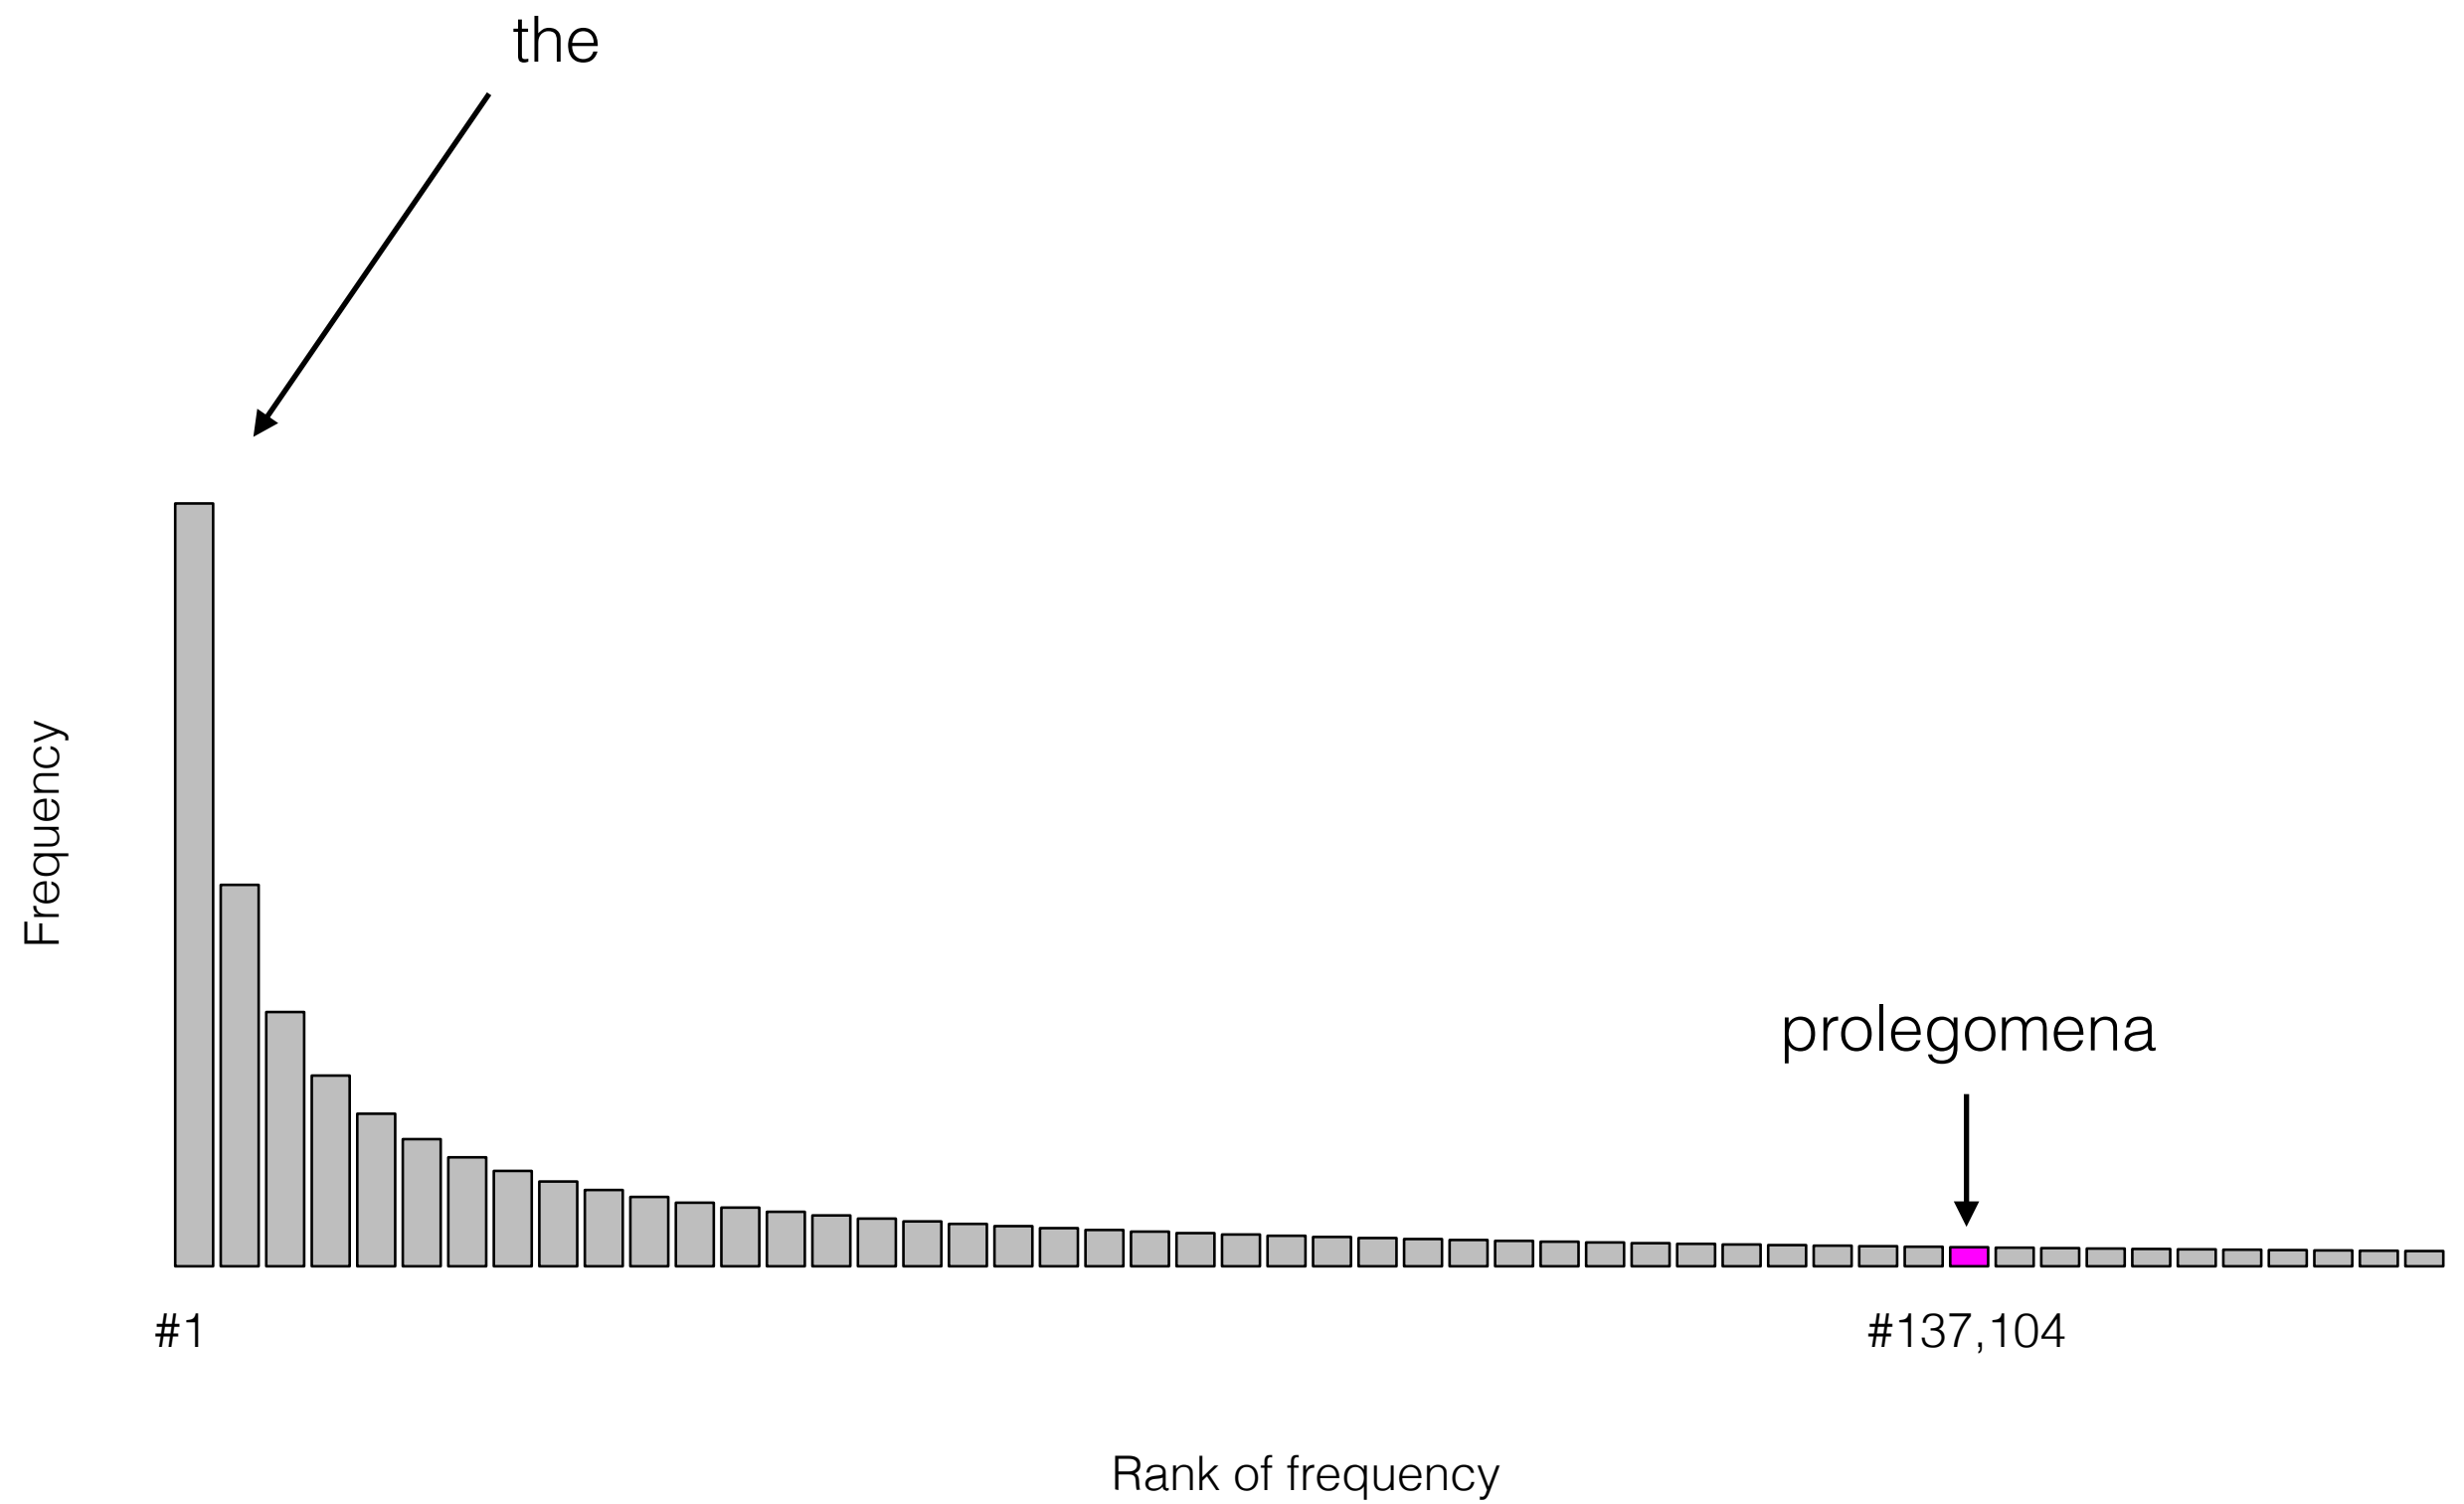

# Zipf's law

- For some phenomena, there's a relationship (power law) between the frequency of an event and the rank of that frequency among all events.
  - Social network degree centrality
  - Populations of cities
  - Word frequency
  - Sales

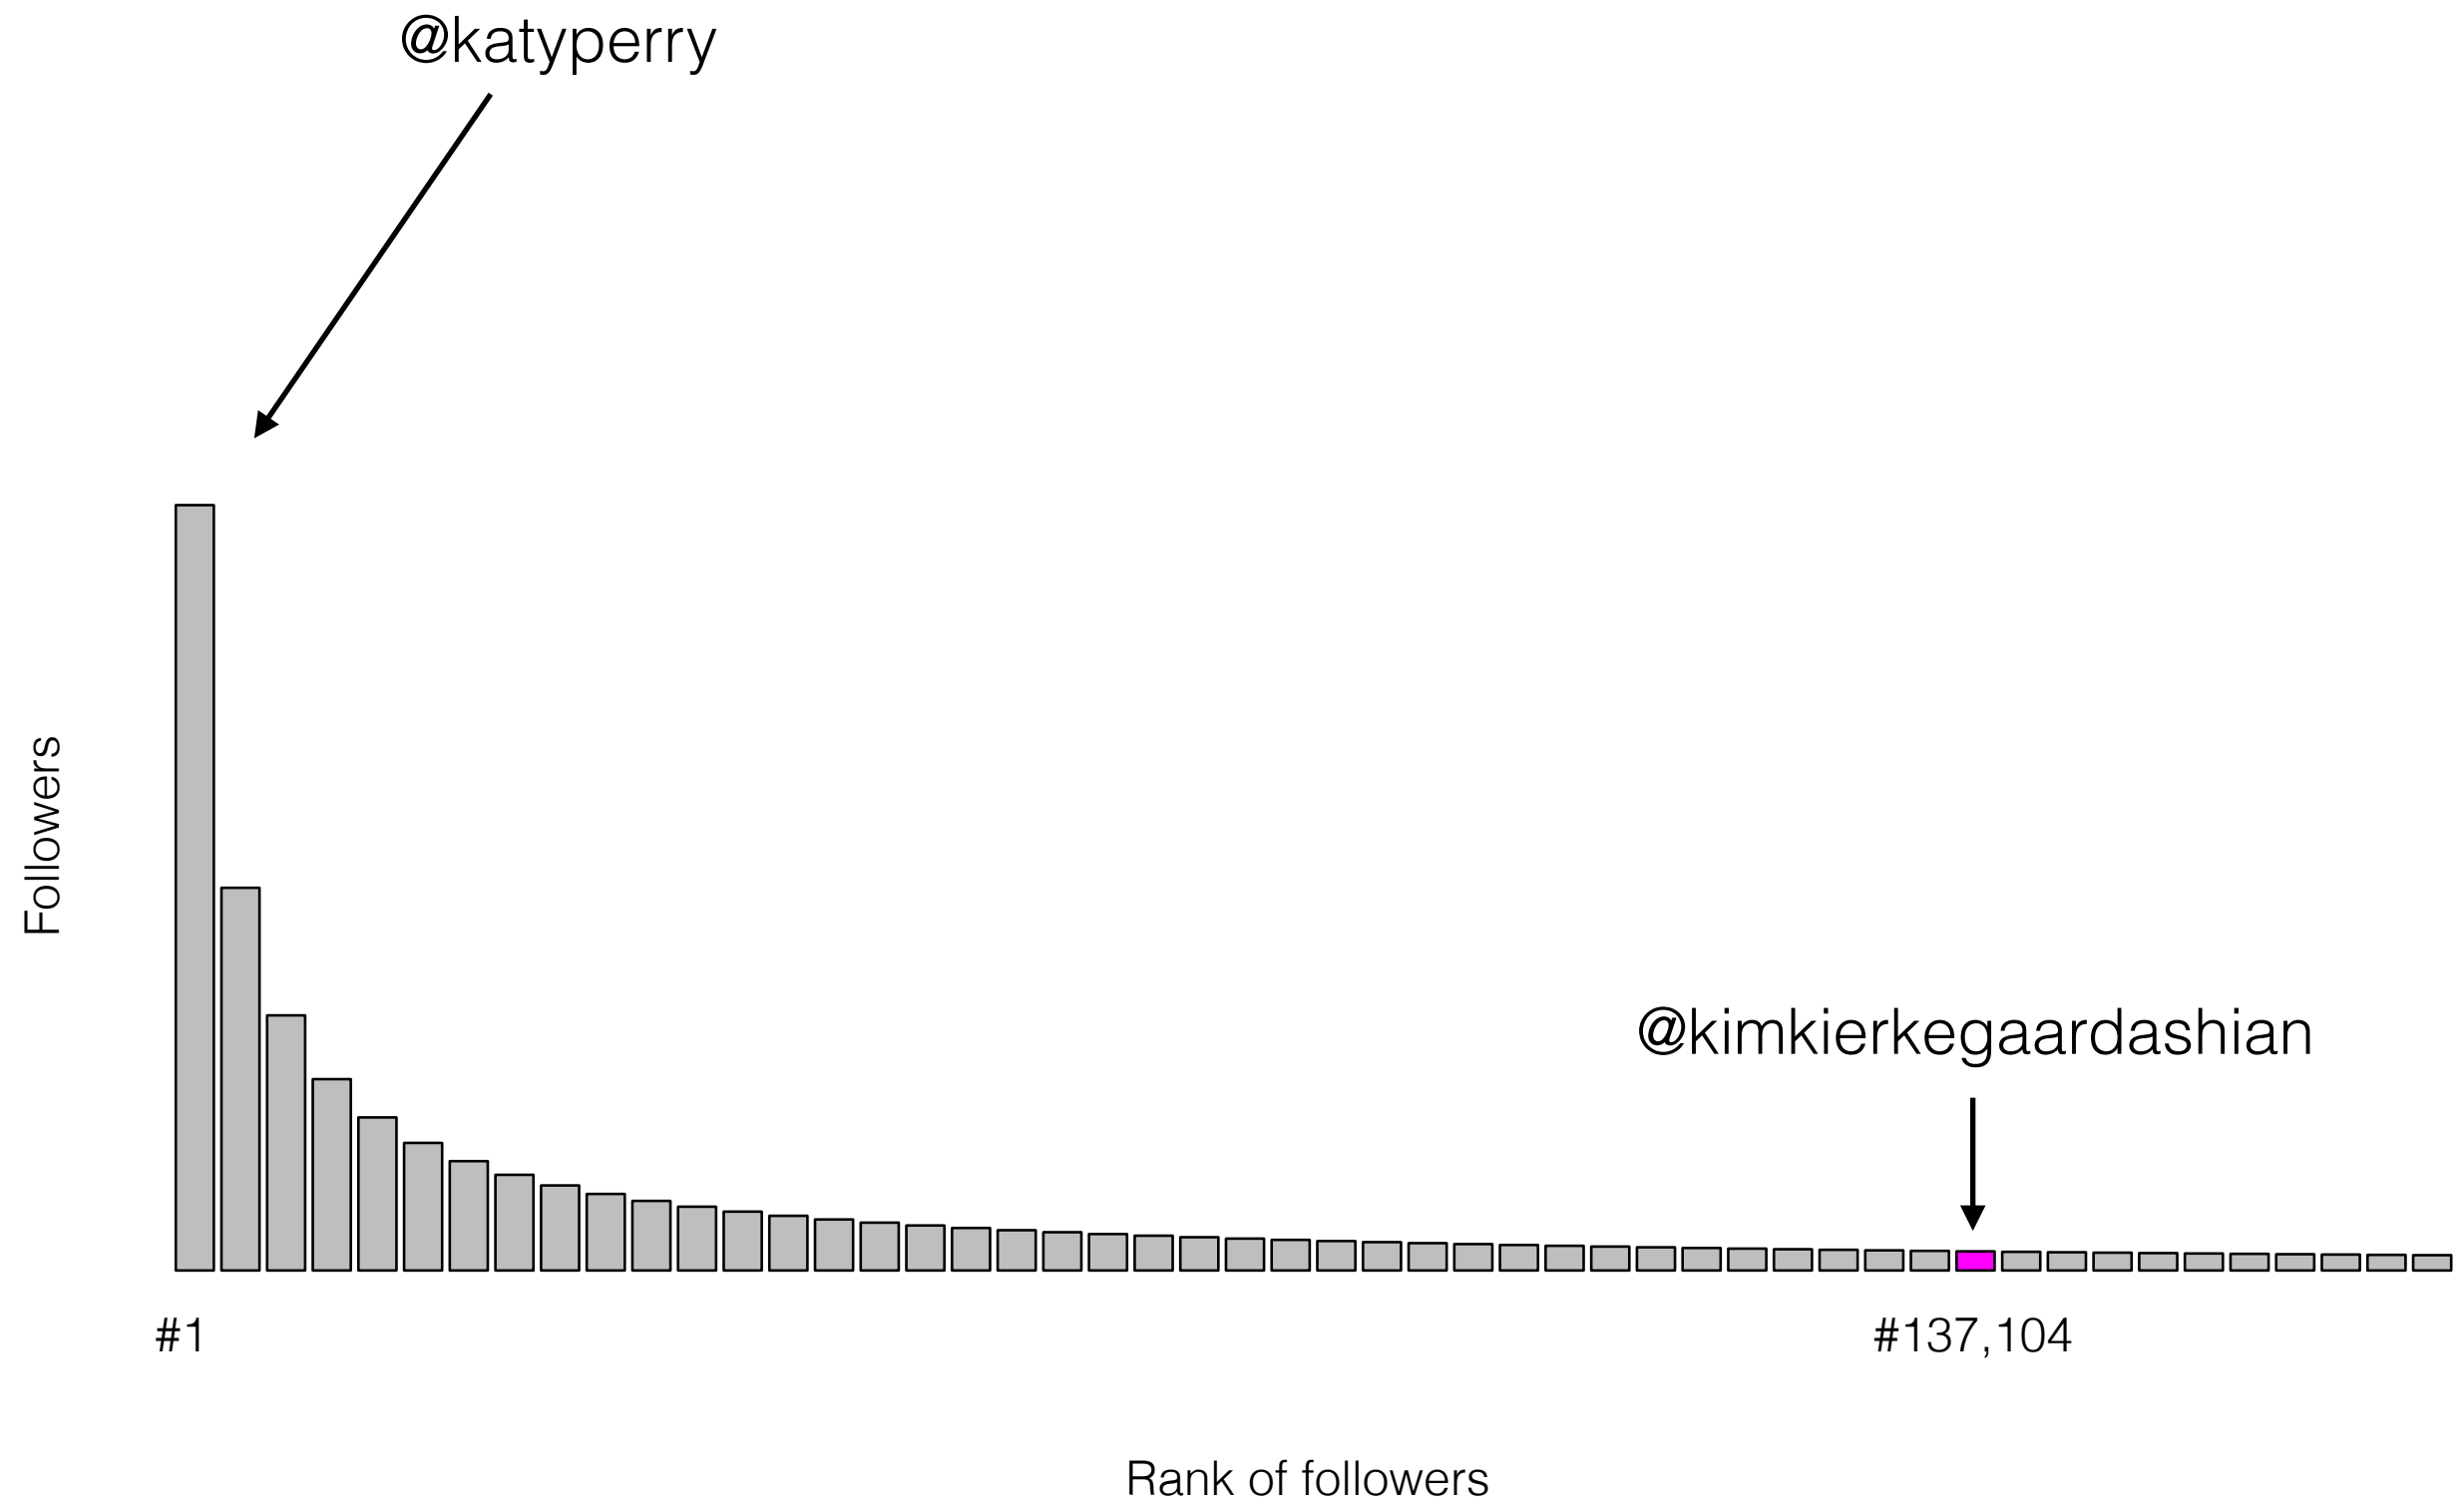

# Long tail

- Aggregate stats (e.g., “bestsellers”) work well for the few items in the frequent end of the tail
- When there’s a long tail of items with few people who care about them, there’s a lot of be gained by highly customized **recommendations**

# Recommendations via DS

- Automatic recommendations draw on classification, clustering, description, structure

# case study: recommendation systems

- Many **resources** we can marshal to make this prediction.
  - Descriptions of the items themselves
  - Data points given to us by company catalog
  - But considerable flexibility in **resource description**

# case study: recommendation systems

- Many **resources** we can marshall to make this prediction.
  - Users who rate movies
  - Recommend movies through the **relationships** they hold to the people who watch them.

# Utility matrix

	Ann	Bob	Chris	David	Erik
Star Wars	5	5	4	5	3
Bridget Jones		4		4	1
Rocky	3		5		
Rambo		?		2	5

How do we get ratings from users?

# Methods

- Content based nearest neighbors
- Classification
- Collaborative filtering

# Content-based nearest neighbors

- Basic idea: Represent a user's features as the average value of those in the movies they like
- Compare that user representation with each movie to find ones that are most similar

space opera	1	1	0	0.66
cartoon	0	0	0	0

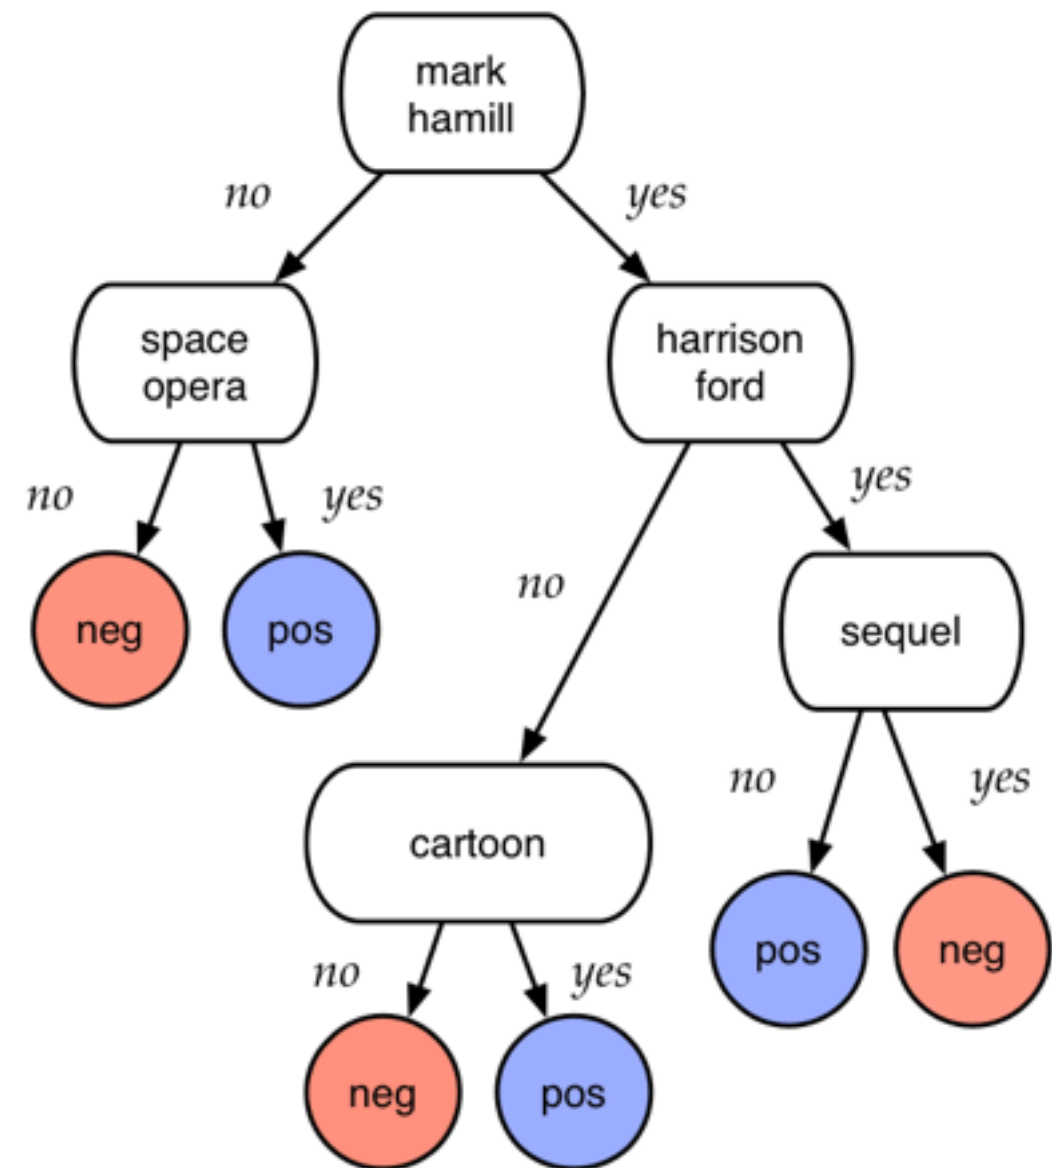

# Cosine Similarity

$$\cos(x, y) = \frac{\sum_{i=1}^F x_i y_i}{\sqrt{\sum_{i=1}^F x_i^2} \sqrt{\sum_{i=1}^F y_i^2}}$$

- Jaccard similarity is measure of **set overlap**.
- Cosine similarity reasons over the value of features (cf. TDO 7.3.6.2)
- Often weighted by TF-IDF to discount the impact of frequent features (cf. 10.4.2.1)

# Classification

- Basic idea: train a separate classifier for each user based on their current ratings
- Insight: reassess movies with no rating

# Content-based classification

- Content-based recommendation (whether through nearest neighbors or classification) is plagued by data sparsity
- Doesn't consider the way in which other people have rated movies and the **structure** that exists between them.

		Ann	Bob	Chris	David	Erik
A	B	5				
C	D	5				
E	F	5				
G	H	4				
I	J	4				
K	L	4				
M	N	3				
O	P	3				
Q	R	2				
S	T	?				

# Collaborative filtering

- Basic idea: rather than recommending based on an item's content (resource description), we'll recommend based on patterns in other user's ratings (and the similarity between users).
- Exploit the assumption that users' tastes have structure
- Learn that if users like A, then they often also like B.

# Collaborative filtering

- Two ways we can do this:
  - User-user similarity
  - Item-item similarity

# Collaborative filtering

	Ann	Bob	Chris	David	Erik
Star Wars	5	5	4	5	3
Bridget Jones		4		4	1
Rocky	3		5		
Rambo		?		2	5

# User-user similarity

1. Represent each user by the movie they've rated
2. Identify the K nearest neighbors (e.g., the K users with the highest cosine similarity)
3. Make a predicted rating about an item by averaged those K users' scores (if they've rated it).

	Ann	Bob	Chris	David	Erik
Star Wars	5	5	4	5	3
Bridget Jones		4		4	1
Rocky	3		5		
Rambo				2	5

# User-user similarity

	Ann	Bob
Star Wars	5	5
Bridget Jones	0	4
Rocky	3	0
Rambo	0	0

$$\cos(x, y) = \frac{\sum_{i=1}^F x_i y_i}{\sqrt{\sum_{i=1}^F x_i^2} \sqrt{\sum_{i=1}^F y_i^2}}$$

# Item-item similarity

1. Represent each item by the users who've rated it.
2. Identify the nearest neighbor (e.g., by cosine similarity) to an item that a given user has rated highly

	Ann	Bob	Chris	David	Erik
Star Wars	5	5	4	5	3
Bridget Jones		4		4	1
Rocky	3		5		
Rambo				2	5

# Tradeoffs

- Level of granularity
- Users like mixtures of many different kinds of things (multiple movie or music genres, for example) → increase the breadth of recommendations.
- Items often only belong to one genre → increase the precision of recommendations.

# Matrix decomposition

- More complex methods explicitly encode the assumption that items and users both contain **latent** features.
- e.g., “movies with happy endings” — we may not ever see it represented as a feature, but it would explain a lot of the commonalities in how different users rate them.

# Matrix decomposition

	Ann	Bob	Chris	David	Erik
SW	5	5	4	5	3
Jones		4		4	1
Rambo	3		5		
Rocky				2	5

 $=$ 

	F1	F2
SW	0.67	1.3
Jones	-1.4	0.1
Rambo	3.12	0.11
Rocky	-1.3	-0.2

 $\times$ 

	Ann	Bob	Chris	David	Erik
F1	1.7	3.1	-0.7	8.3	-4.5
F2	0.1	-0.2	1.3	7.4	-3.4

# Matrix decomposition

- With this (reduced) representation, we can perform the same user-user or item-item queries as before.

	F1	F2			Ann	Bob	Chris	David	Erik
SW	0.67	1.3							
Jones	-1.4	0.1							
Rambo	3.12	0.11							
Rocky	-1.3	-0.2							
			X	F1	1.7	3.1	-0.7	8.3	-4.5
				F2	0.1	-0.2	1.3	7.4	-3.4

## Congratulations!

The Netflix Prize sought to substantially improve the accuracy of predictions about how much someone is going to enjoy a movie based on their movie preferences.

On September 21, 2009 we awarded the \$1M Grand Prize to team "BellKor's Pragmatic Chaos". Read about [their algorithm](#), checkout team scores on the [Leaderboard](#), and join the discussions on the [Forum](#).

We applaud all the contributors to this quest, which improves our ability to connect people to the movies they love.

## Recommendations in an organizing system

- **what** is being organized?
- **why** is it being organized?
- **how much** is it being organized?
- **when** is it being organized?
- **how** (or by whom) is it being organized?
- **where** is it being organized?

- Resources: products (movies, groceries) and the users/customers who interact with them.
- Resource description: deciding what properties of the data we want to use in defining **similarity**.
- Classification, clustering, latent variable modeling as **interactions** to support the end goal
