Intel 4004, 1971

(nb. Moore's Law, 1965)

Cramming more components onto integrated circuits

With unit cost falling as the number of components per circuit rises, by 1975 economics may dictate squeezing as many as 65,000 components on a single silicon chip.

By Gordon E. Moore

Director, Research and Development Laboratories, Fairchild Semiconductor Division of Fairchild Camera and Instrument Corp.

The future of integrated electronics is the future of electronics itself. The advantages of integration will bring about a proliferation of electronics, packing this science into many new areas.

Integrated circuits will lead to such wonders as home computers—or at least terminals connected to a central computer—automatic controls for automobiles, and personal portable communications equipment. The electronic wristwatch needs only a display to be feasible today.

be distributed throughout the machine instead of being concentrated in a central unit. In addition, the improved reliability made possible by integrated circuits will allow the construction of large processing units. Machines similar to those in existence today will be built at lower costs and with faster turn-around.

Present and future

By integrated electronics, I mean all the various

Information: there's growing agreement that it's the name of the age we live in.

when was that?

growing agreement?

Gordon Moore at Fairchild R. & D. in 1952

there's growing *awareness* that ...

self-conscious age of information

"In the long run, history is the story of information becoming aware of itself."

-- James Gleick,
The Information, 2011

over to you ...

1. when did people **become aware** that they lived in an “age of information”?
2. what were the most important innovations of the time and how did they affect this awareness?

I. when did people **become aware** that they lived in an “age of information”?

ahead of his time?

Vicesimus Knox
1752–1821

I. when did people **become aware** that they lived in an “age of information”?

ahead of his time?

Vicesimus Knox
1752–1821

"But though books are easily procured, yet, **even in this age of information**, there are thousands in the lower classes that cannot read. Besides, it is a well-known truth, that the same precepts inculcated by a living instructor, adorned by a proper oratory, enforced by a serious and authoritative manner, produce a powerful effect, not to be experienced in solitary retirement."

-- Vicesimus Knox,
Essays Moral and Literary, 1778

"Wassup, bro?"

2. what were the most important innovations of the time and how did they affect this awareness?

quiet times?

everything's now

Take a look back at some of the most popular TV programs of the mid-1960s — “The Dick Van Dyke Show,” “Bewitched,” even “The Beverly Hillbillies” — and what do you see?

Like today, middle-class Americans typically had washing machines and air-conditioning, telephones and cars. The Internet and video games were not yet invented. But life, over all, did not look that different.

There were TVs and radios in most homes. Millions of people worked in downtown offices and lived in suburbs, connected by multilane highways. Americans’ average life expectancy at birth was 70, only eight years less than it is today.

But flash back 50 years earlier. Then, less than half the population lived in cities. Though Ford Model T’s were starting to roll off the assembly line, Americans typically moved around on horse-drawn buggies on dirt or cobblestone roads. Refrigerators or TVs? Most homes weren’t even wired for electricity. And average life expectancy was only 53.

Mary Tyler Moore in “The Dick Van Dyke Show.” Though the Internet and video games were not yet invented, life over all in the 1960s did not look that different. The Hudson River Museum

tech change — 50 years on

24 Jan: Technological Revolutions

In this class we will look at arguments that suggest or contest the idea that technologies (and particularly information technologies) are capable of changing the world by themselves. Such claims are common today, but as we shall see, they have a long history.

Required Reading

McLuhan, Marshall. 1964. *Understanding Media*. New York: McGraw-Hill.

Read: "Preface to Third Printing" (pp. v-x), and "Introduction" & "The Medium is the Message" (pp. 3-21).

Source: Course reader

Williams, Raymond. 1974. *Television and Cultural Form*. New York: Schocken Books.

Read: Chapter 1, introduction and sections a & b, pp. 1-11; & chapter 5, section c, pp. 119-127.

Source: Course reader

why them?

"what people felt about it"

"very large structural changes that are occurring today... data classification yields to pattern recognition ... 'information overload' ... The young student today grows up in an electronically configured world."

— Marshall McLuhan,
Understanding Media, 1964

Why then?

"Television has now been a ... service for a whole generation"

— Raymond Williams
Television and Cultural Form, 1974

due via bCourses 5 pm Sunday Jan

- answer the questions
- include both readings
- provide page refs or citations
- proofread your answer

assignment

McLuhan writes that "social life is totally threatened by the electric technology" [17] and that, where "print created individualism and nationalism" [19-20], the "electric implosion" [5] by "abolishing both space and time" [3] now "compels commitment and participation" [5] that will ultimately lead to us all living in an interconnected "global village" [111]. Williams, in response, asks whether it is "reasonable to describe any technology as a cause." [9]

Some see our "information age" as the result of another "implosion" beyond McLuhan's dreams. Does McLuhan's or Williams's argument best account for what got us here?
