Chief Information Officer
Department of Defense

DRAFT JEDI Cyber Security Plan*Updated 10 April 2018***0 Purpose**

Security threats are the primary source of risk for any cloud solution. The Joint Enterprise Defense Infrastructure (JEDI) cloud initiative meets this challenge through robustness against known threats and an antifragile posture against future ones. The volatility of technology is not a weakness; it is an opportunity for growth. To that end, this document sets an onerous bar for outcomes but refrains from specificity in implementation. JEDI taps into the rapid adaptation and innovation of the commercial sector to relentlessly improve Department of Defense's services and security.

1 Compliance

1.0 The Contractor is responsible for meeting the requirements specified.

1.1 The Contractor is responsible for following the DoD Cloud Computing Security Requirement Guidelines, with the following exceptions:

1.1.0 Unclassified infrastructure must be logically separated with cryptographic certainty, but need not be physically separated, from other Contractor infrastructure.

1.1.1 Classified infrastructure must be logically separated with cryptographic certainty from other classified infrastructure. Classified infrastructure does not need to be physically separated from other classified infrastructure.

1.1.2 Classified infrastructure must be physically separated from unclassified infrastructure.

1.1.3 Positions without classified infrastructure access may be filled by non-US persons.

1.1.4 Infrastructure is part of the greater Department Of Defense Information Network (DODIN).

1.2 The Contractor must follow the National Industrial Security Program [D.0].

1.3 The internal operators, internal auditors, and external auditors verify compliance.

1.4 The contract defines timelines and metrics, as well as consequences for falling short of them.

1.5 Compliance evaluation takes only recorded communication into consideration.

1.6 In the event of a conflict, the requirements in this document supersede any referenced policy.

2 Operation

2.0 The Contractor, internal auditors, and external auditors report directly to the CIO. The internal operators and CIO do not report to each other. This is to encourage unbiased evaluation.

2.1 The CIO empowers internal operators to conduct missions and testing using infrastructure.

2.2 The CIO may exempt any requirements on a case-by-case basis.

3 Modernization

3.0 Capabilities used to meet requirements evolve at or beyond the speed of commercial offerings.

4 Requirements

4.0 Geographic redundancy enables applications to quickly recover from disaster.

4.0.0 Data centers sufficiently dispersed within US customs territory [D.1] such that applications can support the same overall load in the event of one or more natural or human-made disasters.

4.0.1 High availability unclassified and classified infrastructure in three or more data centers.

4.0.2 Tools that enable applications to harness geographic redundancy and support failover.

4.0.3 Network availability through redundant, globally distributed points of presence controlled by the Contractor and available on all continents (except Antarctica).

4.1 Physical access to infrastructure without authorization is considered logical root access.

4.1.0 Handle classified and unclassified server destruction pursuant to DoD 5220.22-M [D.2].

4.1.1 Classified infrastructure is physically isolated from all other Contractor infrastructure.

4.1.2 Unclassified infrastructure is mixed with public Contractor infrastructure.

4.1.3 Access restriction policies apply to infrastructure pursuant to the DD Form 254 [D.0].

135 4.1.4 Non-network infrastructure must be in US customs territory or military installations [D.1].

136
137 4.1.5 No individual may have both physical and logical access.

138
139 **4.2 Logical** administration and separation enable resource pooling, a key cloud advantage.

140
141 4.2.0 Logical separation with cryptographic certainty of isolation pursuant to CNSSP 15 [D.3].

142
143 4.2.1 Data at rest and in transit encrypted pursuant to CNSSP 15 [D.3].

144
145 4.2.2 Management of encryption keys supported by either the government or Contractor.

146
147 4.2.3 Authentication requires MFA such as DoD PKI [D.4].

148
149 4.2.4 Authentication to classified infrastructure requires DoD PKI [D.4].

150
151 4.2.5 Highly granular access control configuration for compliance with technical policies [D.5].

152
153 4.2.6 Regular software lifecycle and upgrades.

154
155 **4.3 Servers** must be hardened against future hardware vulnerabilities.

156
157 4.3.0 JEDI allocation cannot exceed a significant portion of Contractor allocation.

158
159 4.3.1 Regular hardware lifecycle and upgrades.

160
161 **4.4 Network** security achieved through border control and blending with non-JEDI traffic.

162
163 4.4.0 Intra-application traffic encrypted with cryptographic certainty.

164
165 4.4.1 Inter-application traffic requires CIO approval and cryptographic certainty of encryption.

166
167 4.4.2 Applications globally available and responsive.

168
169 4.4.3 JEDI traffic cannot exceed a significant portion of total Contractor traffic.

170
171 4.4.4 Establishing direct fiber links to DoD Meet-Me-Points for unclassified connections.

172
173 4.4.5 Establishing direct fiber links for classified connections.

175 4.4.6 Internet addressing of JEDI traffic cannot be distinct from other Contractor traffic.

176
177 **4.5 Defense** requires the Contractor, CIO, and internal operators to work closely together.

178
179 4.5.0 The CIO may require specific physical and logical component supply chains.

180
181 4.5.1 The CIO may require specific traffic profiles be intercepted, modified, or stored.

182
183 4.5.2 Internal and boundary security capabilities able to protect applications.

184
185 4.5.3 The CIO may require specific hardware, software, or allocation profiles be blocked.

186
187 4.5.4 Contractor personnel attain training and clearances pursuant to the DD Form 254 [D.0].

188
189 4.5.5 Regular testing of infrastructure, DoD testing allowed on request of CIO.

190
191 4.5.6 Vulnerabilities known to the public, Contractor, or government mitigated.

192
193 4.5.7 Investigations of vulnerability exploitation conducted.

194
195 4.5.8 Activity which reveals DoD usage information is considered an investigation.

196
197 4.5.9 The CIO determines priority between mitigations, then investigations, then testing.

198
199 4.5.10 All information yielded from mitigation, investigation, and testing shared with the CIO.

200
201 4.5.11 Marketplace services rapidly reviewed for compliance by a documented process.

202
203 4.5.12 The Offeror's marketplace must support security scanning of new and existing services
204 being offered and also include a rapid method to notify customers using any marketplace service
205 that a vulnerability has been discovered.

206
207 **4.6 Audits** to determine the extent of compromise from attack must be possible within reason.

208
209 4.6.0 Forensic and compliance audits pursuant to NISTIR 8006 [D.6] coordinated with the CIO.

210
211 4.6.1 Providing information on physical components, logical components, and risk management.

212
213 4.6.2 Providing physical and logical access and location records.

215 4.6.3 Providing allocation and traffic usage records.
216
217 4.6.4 Providing records of internal and boundary security incidents.
218
219 4.6.5 Providing mitigation, investigation, and testing records.
220
221 4.6.6 Providing infrastructure destruction records.
222
223 4.6.7 Records stored with the highest classification level of their source applications.
224
225 4.6.8 Records are available at the request of the CIO and other requiring officials [D.7].
226
227 **4.7 Application** level risk management [D.8] by DoD is enabled via the above requirements.
228

A Scenarios

These are examples of questions the Contractor must be able to answer, and the CIO must be able to verify through records available for audit.

A.0 Unauthorized Access: Who gained access and how did they do so?

A.1 Physical Misuse: What hardware is missing or modified and what devices were left behind?

A.2 Logical Misuse: Which affected accounts took what actions and accessed what data?

A.3 Unexpected Ingress: What behavior signatures did the traffic exhibit?

A.4 Unexpected Egress: What was exfiltrated and to whom was it sent?

A.5 Software Bug: Which applications were affected or exploited?

A.6 Hardware Bug: What infrastructure was affected or exploited and when was it discovered?

B Parties

B.0 Department of Defense (DoD) - Customer for cloud infrastructure.

B.1 Chief information officer (CIO) - The DoD CIO, or their designated authorizing officials.

B.2 Contractor - Contractor responsible for delivering JEDI.

B.3 Internal auditors - The agencies(s) appointed by CIO to audit JEDI (e.g., JFHQ-DODIN).

B.4 External auditors - The contractor(s) directed by CIO to audit JEDI.

B.5 Internal operators - Governmental groups tasked with security (e.g., USCYBERCOM).

C Definitions

C.0 Contract - Agreement between the Contractor and DoD for JEDI cloud.

C.1 Infrastructure - Physical and virtual components that comprise JEDI.

C.2 Account - Provisioned identity able to manage infrastructure and platform services.

C.3 Unclassified infrastructure - FedRAMP Moderate compliant for all unclassified levels.

C.4 Classified infrastructure - FedRAMP High compliant for all classification levels.

C.5 Server - Physical infrastructure related to transforming or storing data (e.g., database).

C.6 Allocation - Server resources dedicated to JEDI as measured by CPU and GPU capacity.

C.7 Network - Physical infrastructure related to packaging or transmitting data (e.g., router).

C.8 Traffic - Internal or external, ingress or egress related to JEDI as measured in bytes.

C.9 Addressing - Data used to route data (e.g., IPv6).

C.10 Data center - A physical site containing significant infrastructure.

C.11 Application - Infrastructure dedicated to and managed by a single account.

C.12 Failover - Unanticipated migration of application operation with minimal downtime.

C.13 Cryptographic certainty - Assurance unmediated data transfer does not occur [D.3].

C.14 Vulnerability - Weaknesses affecting data transfer, service availability, or code execution.

C.15 Testing - Assessments and attacks to verify security compliance and incident response.
